Abstract

Bicyclic graphs are connected graphs in which the number of edges equals the number of vertices plus one. In this paper we determine the graph with the largest spectral radius among all bicyclic graphs with \( n \) vertices and diameter \( d \). As an application, we give first three graphs among all bicyclic graphs on \( n \) vertices, ordered according to their spectral radii in decreasing order.

Keywords: Bicyclic graphs; Eigenvalues; Spectral radius; Diameter

1. Introduction

Let \( G = (V(G), E(G)) \) be a (simple) graph with \( n \) vertices, and let \( A(G) \) be a \((0, 1)\)-adjacency matrix of \( G \). Since \( A(G) \) is symmetric, its eigenvalues are real. Without loss of generality, we can write them as \( \lambda_1(G) \geq \lambda_2(G) \geq \cdots \geq \lambda_n(G) \) and call them the eigenvalues of \( G \). The characteristic polynomial of \( G \) is just \( \det(\lambda I - A(G)) \), and is denoted by \( \phi(G; \lambda) \). The largest
eigenvalue $\lambda_1(G)$ is called the spectral radius of $G$, denoted by $\rho(G)$. If $G$ is connected, then $A(G)$ is irreducible, and by the Perron–Frobenius theory of non-negative matrices, $\rho(G)$ has multiplicity one and there exists a unique positive unit eigenvector corresponding to $\rho(G)$. We shall refer to such an eigenvector as the Perron vector of $G$.

The investigation on the spectral radius of graphs is an important topic in the theory of graph spectra. Recently, the problem of finding all graphs with maximal or minimal spectral radius among a given class of graphs has been studied extensively. For related results, one may refer to [1–9,11–13,15–17] and the references therein.

Bicyclic graphs are connected graphs in which the number of edges equals the number of vertices plus one. Chang et al. [3] determined graphs with the largest spectral radius among all the bicyclic graphs on $n$ vertices with perfect matching. Yu and Tian [17] determined the graph with the largest spectral radius among all the bicyclic graphs on $n$ vertices with a maximum matching of cardinality $m$. Guo et al. [7,13] determined the graph with the largest spectral radius among all the bicyclic graphs with $n$ vertices and $k$ pendant vertices. Simić [15] determined the bicyclic graphs on prescribed number of vertices with spectral radius minimal.

The diameter of a connected graph is the maximum distance between pairs of its vertices. Very recently, Guo et al. [9] determined the graphs with the largest and the second largest spectral radius among all trees with $n$ vertices and diameter $d$. Guo and Shao [6] characterized the first $\left\lfloor \frac{d}{2} \right\rfloor + 1$ trees with $n$ vertices and diameter $d$ ordered according to their spectral radii. Guo [8] determined the graph with the largest spectral radius among all unicyclic graphs with $n$ vertices and diameter $d$.

In this paper, we study the spectral radius of bicyclic graphs with $n$ vertices and diameter $d$, and determine the graph with the largest spectral radius among all bicyclic graphs with $n$ vertices and diameter $d$. As an application, we give first three graphs among all bicyclic graphs on $n$ vertices, ordered according to their spectral radii in decreasing order.

2. Preliminaries

Denote by $C_n$ and $P_n$ the cycle and the path, respectively, each on $n$ vertices. Let $G - uv$ denote the graph that arises from $G$ by deleting the edge $uv \in E(G)$. Similarly, $G + uv$ is the graph that arises from $G$ by adding the edge $uv \notin E(G)$, where $u, v \in V(G)$. For $v \in V(G)$, $N(v)$ denotes the set of all neighbors of vertex $v$ in $G$, and $d(v) = |N(v)|$ denotes the degree of vertex $v$ in $G$. A pendant vertex of $G$ is a vertex of degree 1. A pendant edge is an edge with which a pendant vertex is incident. For a real number $x$, we denote by $\lfloor x \rfloor$ the greatest integer $\leq x$, and by $\lceil x \rceil$ the least integer $\geq x$. We denote by $\mathcal{B}_{n,d}$ the set of all bicyclic graphs with $n$ vertices and diameter $d$. Let $C_p$ and $C_q$ be two vertex-disjoint cycles. Suppose that $a_1$ is a vertex of $C_p$ and $a_1$ is a vertex of $C_q$. Joining $a_1$ and $a_1$ by a path $a_1 a_2 \cdots a_l$ of length $l - 1$ results in a graph $B(p, l, q)$ (Fig. 1) to be called an $\infty$-graph, where $l \geq 1$ and $l = 1$ means identifying $a_1$ with $a_l$. Let $P_{l+1}$, $P_{p+1}$ and $P_{q+1}$ be three vertex-disjoint paths, where $l, p, q \geq 1$ and at most one of them is 1. Identifying the three initial vertices and terminal vertices of them respectively results in a graph $P(l, p, q)$ (Fig. 2) to be called a $\theta$-graph. Obviously $\mathcal{B}_{n,d}$ consists of two types of graphs: one type, denoted by $\mathcal{B}_{n,d}^\infty$, are those graphs each of which is an $\infty$-graph with trees attached; the other type, denoted by $\mathcal{B}_{n,d}^\theta$, are those graphs each of which is a $\theta$-graph with trees attached. Then $\mathcal{B}_{n,d} = \mathcal{B}_{n,d}^\infty \cup \mathcal{B}_{n,d}^\theta$.

In order to complete the proof of our main result, we need the following lemmas.
Lemma 1 [16, 12]. Let $G$ be a connected graph and let $\rho(G)$ be the spectral radius of $A(G)$. Let $u, v$ be two vertices of $G$. Suppose $v_1, v_2, \ldots, v_s \in N(v) \setminus N(u) (1 \leq s \leq d(v))$ and $x = (x_1, x_2, \ldots, x_n)$ is the Perron vector of $A(G)$, where $x_i$ corresponds to the vertex $v_i (1 \leq i \leq n)$. Let $G^*$ be the graph obtained from $G$ by deleting the edges $vv_i$ and adding the edges $uv_i$ $(1 \leq i \leq s)$. If $x_u \geq x_v$, then $\rho(G) < \rho(G^*)$.

By Lemma 1, we obtain easily Lemmas 2 and 3 which may be regarded as immediate consequences of Lemma 1. Since their proofs are similar, we only give the proof of Lemma 2.

Lemma 2. Let $G$ be a connected graph and let $e = uv$ be a non-pendant edge of $G$ with $N(u) \cap N(v) = \emptyset$. Let $G^*$ be the graph obtained from $G$ by deleting the edge $uv$, identifying $u$ with $v$, and adding a pendant edge to $u$ $(= v)$. Then $\rho(G) < \rho(G^*)$.

Proof. We use $x_u$ and $x_v$ to denote the components of the Perron vector of $G$ corresponding to $u$ and $v$ respectively. Suppose that $N(u) = \{v, v_1, \ldots, v_s\}$ and $N(v) = \{u, u_1, \ldots, u_t\}$. Since $e = uv$ is a non-pendant edge of $G$, it follows that $s, t \geq 1$. If $x_u \geq x_v$, let

$$G' = G - \{vu_1, \ldots, vu_t\} + \{uu_1, \ldots, uu_t\}.$$ 

If $x_u < x_v$, let

$$G'' = G - \{uv_1, \ldots, uv_s\} + \{vv_1, \ldots, vv_s\}.$$ 

Obviously, $G^* = G' = G''$. By Lemma 1, we have $\rho(G) < \rho(G^*)$.

This completes the proof. $\square$

Lemma 3. Let $G, G', G''$ be three connected graphs disjoint in pairs. Suppose that $u, v$ are two vertices of $G$, $u'$ is a vertex of $G'$ and $u''$ is a vertex of $G''$. Let $G_1$ be the graph obtained from $G, G', G''$ by identifying, respectively, $u$ with $u'$ and $v$ with $u''$. Let $G_2$ be the graph obtained from $G, G', G''$ by identifying vertices $u, u', u''$. Let $G_3$ be the graph obtained from $G, G', G''$ by identifying vertices $v, u', u''$. Then either $\rho(G_1) < \rho(G_2)$ or $\rho(G_1) < \rho(G_3)$.

Let $G$ be a connected graph, and $uv \in E(G)$. The graph $G_{u,v}$ is obtained from $G$ by subdividing the edge $uv$, i.e., adding a new vertex $w$ and edges $uw, vw$ in $G - uv$. Hoffman and Smith define an internal path of $G$ as a walk $v_0 v_1 \cdots v_s (s \geq 1)$ such that the vertices $v_0, v_1, \ldots, v_s$ are distinct, $d(v_0) > 2, d(v_s) > 2$, and $d(v_i) = 2$, whenever $0 < i < s$ (note, $s$ is the length of the path). An internal path is closed if $v_0 = v_s$. They proved the following result.
Lemma 4 [10]. Let $uv$ be an edge of the connected graph $G$ on $n$ vertices.

(i) If $uv$ does not belong to an internal path of $G$, and $G \neq C_n$, then $\rho(G_{u,v}) > \rho(G)$.

(ii) If $uv$ belongs to an internal path of $G$, and $G/uv = W_n$, where $W_n$ is shown in Fig. 3, then $\rho(G_{u,v}) < \rho(G)$.

Lemma 5 [4]. The characteristic polynomial of $P_n$ satisfies the expression

$$\phi(P_n; \lambda) = \frac{1}{\sqrt{\lambda^2 - 4}} (x_1^{n+1} - x_2^{n+1}),$$

where

$$x_1 = \frac{1}{2} \left( \lambda + \sqrt{\lambda^2 - 4} \right) \quad \text{and} \quad x_2 = \frac{1}{2} \left( \lambda - \sqrt{\lambda^2 - 4} \right)$$

are the roots of the equation $x^2 - \lambda x + 1 = 0$.

Lemma 6 [11,6]. Let $u$ and $v$ be two adjacent vertices of the connected graph $G$ with $d(u) > 1$ and $d(v) > 1$. For non-negative integers $k$ and $l$, let $G(k, l)$ denote the graph obtained from $G$ by adding pendant paths of length $k$ at $u$ and length $l$ at $v$. If $k \geq l \geq 1$, then $\rho(G(k, l)) > \rho(G(k+1, l-1))$.

Lemma 7 [11,6]. Let $G$ be a connected graph, and $G'$ be a proper spanning subgraph of $G$. Then $\rho(G) > \rho(G')$ and $\phi(G'; \lambda) > \phi(G; \lambda)$ for all $\lambda \geq \rho(G)$.

The following two results are often used to calculate the characteristic polynomials of graphs.

Lemma 8 [4,14]. Let $e = uv$ be an edge of $G$, and $C(e)$ be the set of all cycles containing $e$. The characteristic polynomial of $G$ satisfies

$$\phi(G; \lambda) = \phi(G - e; \lambda) - \phi(G - u - v; \lambda) - 2 \sum_{Z \in C(e)} \phi(G \setminus V(Z); \lambda).$$

Lemma 9 [4,14]. Let $u$ be a vertex of $G$, and let $C(u)$ be the set of all cycles containing $u$. The characteristic polynomial of $G$ satisfies

$$\phi(G; \lambda) = \lambda \phi(G - u; \lambda) - \sum_{v \in N(u)} \phi(G - u - v; \lambda) - 2 \sum_{Z \in C(u)} \phi(G \setminus V(Z); \lambda).$$

As usual, we assume that the characteristic polynomial of an empty graph is equal to 1. Let $d \geq 2$ and $2 \leq i \leq d$. We denote by $P^*_d(i)$ the graph obtained from a path $P_{d+1} = v_1v_2 \cdots v_{d+1}$ and isolated vertices $v_{d+2}, \ldots, v_n$ by adding edges $v_i v_{d+2}, \ldots, v_i v_n$. Denote by $P^\Delta_{d+1}(i)$ the graph obtained from $P^*_d(i)$ by adding edges $v_{d+2} v_{d+3}$ and $v_{d+4} v_{d+5}$, by $P^\Delta_{d+1}(i)$ the graph
obtained from $P_{d+1}^*(i)$ by adding edges $v_{i-1}v_{d+2}$ and $v_{d+3}v_{d+4}$, by $P_{d+1}^{\Delta\Delta}(i)$ the graph obtained from $P_{d+1}^*(i)$ by adding edges $v_{i-1}v_{d+2}$ and $v_{i+1}v_{d+3}$, and by $P_{d+1}^+(i)$ the graph (Fig. 7) obtained from $P_{d+1}^*(i)$ by adding edges $v_{i-1}v_n$ and $v_{i+1}v_n$.

**Lemma 10.** Let $d \geq 3$. Then $\rho(P_{d+1}^{\Delta\Delta}(i)) \geq \rho(P_{d+1}^{\Delta\Sigma}(i)) \geq \rho(P_{d+1}^{\Sigma\Sigma}(i))$ with the first equality if and only if $i = d$ and the second equality if and only if $i = 2$.

**Proof.** Clearly, $P_{d+1}^{\Delta\Delta}(d) = P_{d+1}^{\Delta\Sigma}(d)$, $P_{d+1}^{\Delta\Sigma}(2) = P_{d+1}^{\Sigma\Sigma}(2)$. Denote by $P_{d+1}^\Delta$ the obtained graph $P_{d+1}^*(i)$ by adding edge $v_{i-1}v_{d+2}$.

For $2 \leq i < d$, applying Lemma 8 to edge $v_{i-1}v_{d+3}$ of $P_{d+1}^{\Delta\Delta}(i)$ and edge $v_{d+3}v_{d+4}$ of $P_{d+1}^{\Delta\Sigma}(i)$ respectively, we have

$$\phi(P_{d+1}^{\Delta\Delta}(i); \lambda) = \phi(P_{d+1}^{\Delta\Sigma}(i); \lambda) - \phi(P_{d+1}^{\Delta\Delta}(i) - v_{i-1} - v_{d+3}; \lambda) - 2\lambda^{d-3} \phi(P_i; \lambda) \phi(P_{d-i}; \lambda),$$

$$\phi(P_{d+1}^{\Delta\Sigma}(i); \lambda) = \phi(P_{d+1}^{\Delta\Sigma}(i); \lambda) - \phi(P_{d+1}^{\Delta\Sigma}(i) - v_{d+3} - v_{d+4}; \lambda) - 2\lambda^{d-4} \phi(P_i; \lambda) \phi(P_{d-i}; \lambda).$$

Note that $P_{d+1}^{\Delta\Delta}(i) - v_{i-1} - v_{d+3}$ is a proper spanning subgraph of $P_{d+1}^{\Delta\Sigma}(i) - v_{d+3} - v_{d+4}$, and $K_1 \cup P_{d-i}$ is a proper spanning subgraph of $P_{d-i+1}$. By Lemma 7 we have

$$\phi(P_{d+1}^{\Delta\Sigma}(i); \lambda) - \phi(P_{d+1}^{\Delta\Delta}(i); \lambda) = \phi(P_{d+1}^{\Delta\Sigma}(i) - v_{i-1} - v_{d+3}; \lambda) - \phi(P_{d+1}^{\Delta\Sigma}(i) - v_{d+3} - v_{d+4}; \lambda) + 2\lambda^{d-4} \phi(P_i; \lambda) [\lambda \phi(P_{d-i}; \lambda) - \phi(P_{d-1}; \lambda)] > 0$$

for all $\lambda \geq \rho(P_{d+1}^{\Delta\Sigma}(i))$. Thus $\rho(P_{d+1}^{\Delta\Delta}(i)) > \rho(P_{d+1}^{\Delta\Sigma}(i))$.

For $3 \leq i \leq d$, applying Lemma 8 to edge $v_{i-1}v_{d+2}$ of $P_{d+1}^{\Delta\Sigma}(i)$ and edge $v_{d+2}v_{d+3}$ of $P_{d+1}^{\Sigma\Sigma}(i)$ respectively, by similar reasoning as above, we have

$$\phi(P_{d+1}^{\Sigma\Sigma}(i); \lambda) = \phi(P_{d+1}^{\Sigma\Sigma}(i) - v_{d+2} - v_{d+3}; \lambda) + 2\lambda^{d-5} (\lambda^2 - 1) \phi(P_{d-i+1}; \lambda) [\lambda \phi(P_{d-i-1}; \lambda) - \phi(P_{d-1}; \lambda)] > 0$$

for all $\lambda \geq \rho(P_{d+1}^{\Sigma\Sigma}(i))$. Thus $\rho(P_{d+1}^{\Delta\Sigma}(i)) > \rho(P_{d+1}^{\Sigma\Sigma}(i))$.

This completes the proof. $\square$

**Lemma 11.** Let $G_1(i)$, $G_2(i)$ and $P_{d+1}^\theta(i)$, shown in Figs. 4–6, belong to $\bar{B}_{n,d}$. Then

$$\rho(G_1(i)) < \rho(G_2(i)) \leq \rho(P_{d+1}^\theta(i)),$$

and the equality holds if and only if $i = 2$.

![Fig. 4. $G_1(i)$](image-url)
Proof. Applying Lemma 8 to edge $v_{n-2}v_{n-1}$ of $G_1(i)$ and edge $v_iv_n$ of $G_2(i)$ respectively, we have

$$
\phi(G_1(i); \lambda) = \phi(G_1(i) - v_{n-2}v_{n-1}; \lambda) - \phi(G_1(i) - v_{n-2} - v_{n-1}; \lambda) - 2\phi(G_1(i) - v_{n-2} - v_{n-1} - v_n; \lambda),
$$

$$
\phi(G_2(i); \lambda) = \phi(G_2(i) - v_iv_n; \lambda) - \phi(G_2(i) - v_i - v_n; \lambda) - 2\phi(G_2(i) - v_i - v_n - v_{n-2}; \lambda),
$$

for all $\lambda \geq \rho(G_1(i) - v_{n-2} - v_{n-1})$ and

$$
\phi(G_2(i) - v_i - v_n - v_{n-2}; \lambda) > \phi(G_1(i) - v_{n-2} - v_{n-1} - v_n; \lambda)
$$

for all $\lambda \geq \rho(G_1(i))$. These imply that $\phi(G_1(i); \lambda) > \phi(G_2(i); \lambda)$ for all $\lambda \geq \rho(G_1(i))$. Thus $\rho(G_1(i)) < \rho(G_2(i))$.

Clearly, $G_2(2) = P^{\theta}_{d+1}(2)$. For $3 \leq i \leq d$, applying Lemma 8 to edge $v_{n-2}v_n$ of $G_2(i)$ and edge $v_{i-1}v_n$ of $P^{\theta}_{d+1}(i)$ respectively, we have

$$
\phi(G_2(i); \lambda) = \phi(G_2(i) - v_{n-2}v_n; \lambda) - \phi(G_2(i) - v_{n-2} - v_n; \lambda) - 2\lambda^{n-d-3} \phi(P_{i-1}; \lambda) \phi(P_{d-i+1}; \lambda) - 2\lambda^{n-d-4} \phi(P_{i-1}; \lambda) \phi(P_{d-i+1}; \lambda),
$$

$$
\phi(P^{\theta}_{d+1}(i); \lambda) = \phi(P^{\theta}_{d+1}(i) - v_{i-1}v_n; \lambda) - \phi(P^{\theta}_{d+1}(i) - v_{i-1} - v_n; \lambda) - 2\lambda^{n-d-2} \phi(P_{i-2}; \lambda) \phi(P_{d-i+1}; \lambda) - 2\lambda^{n-d-3} \phi(P_{i-2}; \lambda) \phi(P_{d-i+1}; \lambda).
$$

Applying Lemma 8 to edge $v_{n-1}v_n$ of $G_2(i) - v_{n-2}v_n$ and edge $v_{i-1}v_{n-1}$ of $P^{\theta}_{d+1}(i) - v_{i-1}v_n$ respectively, by similar arguments to the proof of Lemma 10 we can show

$$
\phi(G_2(i) - v_{n-2}v_n; \lambda) > \phi(P^{\theta}_{d+1}(i) - v_{i-1}v_n; \lambda)
$$
Applying Lemma 9 several times we have

\[ \text{Lemma 12.} \]

for all \( \lambda \geq \rho(G_2(i)) \). Note that \( P_0^{\theta}(i) - v_1 - v_n \) is proper spanning subgraph of \( G_2(i) - v_{n-2} - v_n \). By Lemma 7 we have

\[ \phi(P_0^{\theta}(i) - v_1 - v_n; \lambda) > \phi(G_2(i) - v_{n-2} - v_n; \lambda) \]

for all \( \lambda \geq \rho(G_2(i)) - v_{n-2} - v_n \). Moreover, since \( \lambda \phi(P_{i-2}; \lambda) - \phi(P_{i-1}; \lambda) = \phi(P_{i-3}; \lambda) > 0 \) for all \( \lambda \geq \rho(G_2(i)) > 2 \), it follows that

\[ 2\lambda^{n-d-2} \phi(P_{i-2}; \lambda) \phi(P_{d-i+1}; \lambda) > 2\lambda^{n-d-3} \phi(P_{i-1}; \lambda) \phi(P_{d-i+1}; \lambda) \]

and

\[ 2\lambda^{n-d-3} \phi(P_{i-2}; \lambda) \phi(P_{d-i+1}; \lambda) > 2\lambda^{n-d-4} \phi(P_{i-1}; \lambda) \phi(P_{d-i+1}; \lambda) \]

for all \( \lambda \geq \rho(G_2(i)) \). These imply that

\[ \phi(G_2(i); \lambda) > \phi(P_0^{\theta}(i); \lambda) \]

for all \( \lambda \geq \rho(G_2(i)) \). Thus \( \rho(G_2(i)) < \rho(P_0^{\theta}(i)) \).

This completes the proof. \( \square \)

**Lemma 12.** If \( n \geq d + 4 \) and \( d \geq 4 \) is even, then \( \rho \left( P_0^{\theta}(d+1 \left( \frac{d+4}{2} \right)) \right) < \rho \left( P_0^{\theta}(d+1 \left( \frac{d+2}{2} \right)) \right) \).

**Proof.** Let \( a = \frac{d+2}{2} \). Denote \( P_0^{\theta}(d+1 \left( \frac{d+4}{2} \right)) \) by \( G(a+1, a) \), and \( P_0^{\theta}(d+1 \left( \frac{d+2}{2} \right)) \) by \( G(a, a+1) \).

Applying Lemma 9 several times we have

\[ \phi \left( P_0^{\theta}(d+1 \left( \frac{d+4}{2} \right)); \lambda \right) - \phi \left( P_0^{\theta}(d+1 \left( \frac{d+2}{2} \right)); \lambda \right) \]

\[ = \phi(G(a+1, a); \lambda) - \phi(G(a, a+1); \lambda) \]

\[ = \lambda \phi(G(a, a); \lambda) - \phi(G(a-1, a); \lambda) - \lambda \phi(G(a, a); \lambda) + \phi(G(a, a-1); \lambda) \]

\[ = \phi(G(a, a-1); \lambda) - \phi(G(a-1, a); \lambda) = \cdots = \phi(G(1, 0); \lambda) - \phi(G(0, 1); \lambda) \]

\[ = \lambda \phi(G(0, 0); \lambda) - \phi(K_{1,n-d-1}; \lambda) - \lambda \phi(G(0, 0); \lambda) + \lambda^{n-d-3} \phi(K_{1,2}; \lambda) > 0 \]

for all \( \lambda \geq \rho \left( P_0^{\theta}(d+1 \left( \frac{d+4}{2} \right)) \right) \). Thus \( \rho \left( P_0^{\theta}(d+1 \left( \frac{d+4}{2} \right)) \right) < \rho \left( P_0^{\theta}(d+1 \left( \frac{d+2}{2} \right)) \right) \).

This completes the proof. \( \square \)

**Lemma 13.** If \( n \geq d + 3 \) and \( 2 \leq i - 2 \leq d - i + 1 \), then \( \rho \left( P_0^{\theta}(i) \right) < \rho \left( P_0^{\theta}(i) \right) \).
Proof. Applying Lemma 8 to edge \( v_{i-1}v_n \) of \( P^\theta_{d+1}(i) \) and edge \( v_nv_{i+1} \) of \( P^+_d(i) \), and then applying Lemma 9 to the highest degree vertices of \( P^\theta_{d+1}(i) - v_{i-1} - v_n \) and \( P^+_d(i) - v_n - v_{i+1} \) respectively, we have

\[
\phi(P^\theta_{d+1}(i); \lambda) - \phi(P^+_d(i); \lambda) = 2\lambda^{n-d-3}(P_{i-2}; \lambda)\phi(P_{d-i-1}; \lambda) + \lambda^{n-d-3}[\lambda^2 + 2\lambda - (n - d - 2)]
\]

\[
\times [\phi(P_{i-1}; \lambda)\phi(P_{d-i}; \lambda) - \phi(P_{i-2}; \lambda)\phi(P_{d-i+1}; \lambda)].
\]

**Case 1.** \( i - 2 < d - i + 1 \). Applying Lemma 9 several times, we have further

\[
\phi(P_{i-1}; \lambda)\phi(P_{d-i}; \lambda) - \phi(P_{i-2}; \lambda)\phi(P_{d-i+1}; \lambda) = \phi(P_{i-2}; \lambda)\phi(P_{d-i-1}; \lambda) - \phi(P_{i-3}; \lambda)\phi(P_{d-i}; \lambda)
\]

\[
= \cdots = \phi(P_2; \lambda)\phi(P_{d-2i+3}; \lambda) - \phi(P_{d-2i+4}; \lambda)
\]

\[
= \lambda\phi(P_{d-2i+2}; \lambda) - \phi(P_{d-2i+3}; \lambda) = \phi(P_{d-2i+1}; \lambda) \geq 0
\]

for all \( \lambda \geq \rho(P_{d-2i+3}) \). It follows that

\[
\phi(P^\theta_{d+1}(i); \lambda) - \phi(P^+_d(i); \lambda) > 0
\]

for all \( \lambda \geq \rho(P^\theta_{d+1}(i)) > \sqrt{n - d + 1} \). Thus \( \rho(P^\theta_{d+1}(i)) < \rho(P^+_d(i)) \).

**Case 2.** \( i - 2 > d - i + 1 \). Then \( d - 2i + 3 = 0 \). Similarly to Case 1, we have

\[
\phi(P_{i-1}; \lambda)\phi(P_{d-i}; \lambda) - \phi(P_{i-2}; \lambda)\phi(P_{d-i+1}; \lambda) = \phi(P_2; \lambda) - \lambda^2 = -1.
\]

From Lemma 5 we can easily get that \( \phi(P_{i}; \lambda) \) is equal to \( \frac{\sinh((n+1)\theta)}{\sinh(\theta)} \) after putting \( \lambda = 2 \cosh(\theta) \). Making use of this fact, we easily get that \( \phi(P_{i-2}; \lambda)\phi(P_{d-i-1}; \lambda) \geq \lambda^2 \), for \( \lambda \geq 2 \) and \( d - i + 1 \geq 3 \) (follows from the fact that \( \sinh(2\lambda) = 2 \sinh(x) \cosh(x) \) and that \( \cosh \) and \( \sinh \) are increasing functions in the interval \( [0, \infty) \)). Combining the above arguments, in this case we have

\[
\phi(P^\theta_{d+1}(i); \lambda) - \phi(P^+_d(i); \lambda)
\]

\[
= \lambda^{n-d-3}[2\phi(P_{i-2}; \lambda)\phi(P_{d-i-1}; \lambda) - \lambda^2 - 2\lambda + n - d - 2]
\]

\[
\geq \lambda^{n-d-3}[2\lambda^2 - \lambda^2 - 2\lambda + n - d - 2] = \lambda^{n-d-3}(\lambda^2 - 2\lambda + n - d - 2) > 0
\]

for all \( \lambda \geq \rho(P^\theta_{d+1}(i)) > \sqrt{n - d + 1} \geq 2 \). Thus \( \rho(P^\theta_{d+1}(i)) < \rho(P^+_d(i)) \).

This completes the proof. \( \square \)

**Lemma 14.** Let \( d \geq 3 \) and \( n \geq d + 3 \). Then \( \rho(G_3(i)) < \rho(P^+_d(i)) \).

**Proof.** Let \( a = i - 2, b = d - i \) and \( G_0(i) = G_3(i) - \{v_{d+2}, \ldots, v_{n-1}\} \). Applying Lemma 9 to vertices \( v_{d+2}, \ldots, v_{n-1} \) of \( G_3(i) \) and to vertices \( v_{d+2}, \ldots, v_{n-1} \) of \( P^+_d(i) \) respectively, we have
where $\Delta - P_a$ is the graph obtained from a cycle $C_3 : u_1u_2u_3$ and a path $P_a$ by joining $u_3$ and an end vertex of $P_a$. Applying Lemma 9 to $v_{a+3}$ of $P_{d+1}$ and $u_1$ of $\Delta - P_a$ respectively, we have

$$\phi(G_3(i); \lambda) - \phi(P_{d+1}^+(i); \lambda) = (n - d - 2)\lambda^{n-d-3}[(\lambda)\phi(P_a; \lambda)\phi(P_b; \lambda) - \phi(P_a+2; \lambda)\phi(P_b-1; \lambda)].$$

From this we can see that it is sufficient to show for all $\lambda \geq \rho(G_3(i))$ that

$$(\lambda + 2)\phi(P_a; \lambda)\phi(P_b; \lambda) - \phi(P_a+2; \lambda)\phi(P_b-1; \lambda) > 0.$$ 

By Lemma 5, we have $x_1 + x_2 = \lambda$, $x_1x_2 = 1$ and

$$(\lambda + 2)\phi(P_a; \lambda)\phi(P_b; \lambda) - \phi(P_a+2; \lambda)\phi(P_b-1; \lambda) = \frac{1}{\lambda^2 - 4}\left[2x_1^d + 2x_2^d + x_1^d - x_2^d - x_1^{a-b+3} + x_2^{a-b+3} - x_1^{a-b+1} - x_2^{a-b+1} - x_1^{a-b} - 2x_2^{a-b} - x_1^{a-b+1} + x_2^{a-b+1} + x_1^{a-b+3} + x_2^{a-b+3} - x_1^{a-b} - x_2^{a-b} \right].$$

Since $\rho(G_3(i)) > \sqrt{n - d + 1}$, it follows that $x_1 > 1$ and $x_2 > 0$ when $\lambda \geq \rho(G_3(i))$. Let $r > 1$. It is easy to see that function $f(x) = r^x + r^{-x}$ is increasing strictly on interval $[0, +\infty)$. We consider the following two cases.

**Case 1.** $a \geq b - 1$. Since $a + b = d - 2$, it follows that $d - 1 \geq a - b + 1$. For all $\lambda \geq \rho(G_3(i))$, by $x_1x_2 = 1$ we have further

$$(\lambda + 2)\phi(P_a; \lambda)\phi(P_b; \lambda) - \phi(P_a+2; \lambda)\phi(P_b-1; \lambda) = \frac{1}{\lambda^2 - 4}\left[2x_1^d + 2x_2^d + x_1^d - x_2^d - x_1^{a-b+3} + x_2^{a-b+3} - x_1^{a-b+1} - x_2^{a-b+1} - x_1^{a-b} - 2x_2^{a-b} - x_1^{a-b+1} + x_2^{a-b+1} + x_1^{a-b+3} + x_2^{a-b+3} - x_1^{a-b} - x_2^{a-b} \right] > 0.$$

**Case 2.** $a \leq b - 2$. By $x_1x_2 = 1$ we have further

$$(\lambda + 2)\phi(P_a; \lambda)\phi(P_b; \lambda) - \phi(P_a+2; \lambda)\phi(P_b-1; \lambda) = \frac{1}{\lambda^2 - 4}\left[2x_1^d + 2x_2^d + x_1^d - x_2^d - x_1^{b-a-3} - x_2^{b-a-3} - x_1^{b-a-1} - x_2^{b-a-1} - x_1^{b-a} - 2x_2^{b-a} - x_1^{b-a} \right] = \frac{1}{\lambda^2 - 4}\left[2\left[(x_1^d + x_1^{(b-a)}) - (x_1^{b-a+1} + x_1^{(b-a+1)}) \right] - \left[(x_1^{b-a+1} + x_1^{(b-a+1)}) - (x_1^{b-a-3} + x_1^{(b-a-3)}) + \left[(x_1^{d-1} + x_1^{(d-1)}) - (x_1^{b-a-1} + x_1^{(b-a-1)}) \right].$$
By \( a + b = d - 2 \), we have \( d - (b - a) = 2a + 2 \geq 2 \). For \( r > 1 \), since \( f''(x) = (\ln r)^2(r^x + r^{-x}) > 0 \) for all \( x \) in \([0, +\infty)\), it follows that \( f(x) \) is concave up on \((0, +\infty)\). Therefore

\[
\begin{align*}
  f(d) - f(b - a) &> f(b - a + 1) - f(b - a - 1), \\
  f(d) - f(b - a) &> f(b - a - 1) - f(b - a - 3)
\end{align*}
\]

and so

\[
2[f(d) - f(b - a)] > f(b - a + 1) - f(b - a - 3).
\]

This implies that

\[
2\left[(x_1^d + x_1^{-d}) - (x_1^{b-a} + x_1^{-(b-a)})\right] > \left(x_1^{b-a+1} + x_1^{-(b-a+1)}\right) - \left(x_1^{b-a-3} + x_1^{-(b-a-3)}\right)
\]

for \( \lambda \geq \rho(G_3(i)) \). Hence, for all \( \lambda \geq \rho(G_3(i)) \), we have

\[
(\lambda + 2)\phi(P_a; \lambda)\phi(P_b; \lambda) - \phi(P_{a+2}; \lambda)\phi(P_{b-1}; \lambda) > 0.
\]

Combining Cases 1 and 2, the proof follows. \( \square \)

**Lemma 15.** Let \( i - 2 \geq d - i + 2 \). Then \( \rho\left(P_{d+1}^+(i)\right) < \rho\left(P_{d+1}^+(i - 1)\right) \).

**Proof.** Let \( a = i - 2 \) and \( b = d - i \). Denote \( P_{d+1}^+(i) \) by \( G(a, b) \). Similarly, denote \( P_{d+1}^+(i - 1) \) by \( G(a - 1, b + 1) \). Applying Lemma 9 several times we have

\[
\begin{align*}
  \phi(P_{d+1}^+(i); \lambda) &- \phi(P_{d+1}^+(i - 1); \lambda) \\
  &= \phi(G(a, b); \lambda) - \phi(G(a - 1, b + 1); \lambda) \\
  &= \lambda\phi(G(a - 1, b); \lambda) - \phi(G(a - 2, b); \lambda) - \lambda\phi(G(a - 1, b); \lambda) \\
  &\quad + \phi(G(a - 1, b - 1); \lambda) \\
  &= \lambda\phi(G(a - 1, b - 1); \lambda) - \phi(G(a - 2, b); \lambda) \\
  &= \cdots = \phi(G(a - b, 0); \lambda) - \phi(G(a - b - 1, 1); \lambda) \\
  &= \lambda^{n-d-2}(\lambda + 1)^2\phi(P_{a-b-2}; \lambda) > 0
\end{align*}
\]

for all \( \lambda \geq \rho(P_{d+1}^+(i)) \). Thus \( \rho\left(P_{d+1}^+(i)\right) < \rho\left(P_{d+1}^+(i - 1)\right) \).

This completes the proof. \( \square \)

### 3. Main results

**Theorem 1.** Let \( n \geq d + 4 \) and \( G \in \mathcal{B}_{n,d} \). If \( d \geq 4 \), then

\[
\rho(G) \leq \rho\left(P_{d+1}^+\left(\left\lfloor \frac{d+2}{2} \right\rfloor \right)\right)
\]

with equality if and only if \( G = P_{d+1}^+\left(\left\lfloor \frac{d+2}{2} \right\rfloor \right) \); if \( d = 3 \), then \( \rho(G) \leq \rho(P_4^0(3)) \) with equality if and only if \( G = P_4^0(3) \).

**Proof.** Choose \( G \in \mathcal{B}_{n,d} \) such that the spectral radius of \( G \) is as large as possible. Denote the vertex set of \( G \) by \( \{v_1, v_2, \ldots, v_n\} \) and the Perron vector of \( G \) by \( x = (x_1, x_2, \ldots, x_n) \), where \( x_i \) corresponds to the vertex \( v_i \) \( (1 \leq i \leq n) \). We first prove the following fact. \( \square \)
Fact 1. There is not an internal path of \( G \) with length greater than 1 unless the path lies on a cycle of length 3.

Proof. Assume, on the contrary, that \( P_{k+1} : v_i v_{i+1} \cdots v_{i+k} \) is an internal path of \( G \) with length \( k \geq 2 \) and \( P_{k+1} \) does not lie on a cycle of length 3. Let \( G' = G - \{v_i v_{i+1}, v_{i+1} v_{i+2} \} + \{v_i v_{i+2} \} \). If the diameter of \( G' - v_{i+1} \) is \( d \), it is easy to see that there is \( v \in V(G' - v_{i+1}) \) such that \( G^* = G' + \{v v_{i+1} \} \). If the diameter of \( G' - v_{i+1} \) is \( d - 1 \), then any shortest path of \( G \) between two vertices with length \( d \) contains \( v_i v_{i+1} \cdots v_{i+k} \) as a part. Let \( v \) be an initial vertex of such a path and let \( G^* = G' + \{v v_{i+1} \} \), then \( G^* \in \mathcal{B}_{n,d} \). By Lemmas 4 and 7, in both cases we have \( \rho(G^*) > \rho(G) \), a contradiction. This completes the proof of Fact 1. \( \square \)

Let \( P_{d+1} \) be a shortest path between two vertices of \( G \) with length \( d \). Since \( \mathcal{B}_{n,d} = \mathcal{B}^\infty_{n,d} \cup \mathcal{B}^0_{n,d} \), it follows that \( G \in \mathcal{B}^\infty_{n,d} \) or \( G \in \mathcal{B}^0_{n,d} \). Now we distinguish two cases to determine \( G \).

Case 1. Suppose that \( G \in \mathcal{B}^\infty_{n,d} \). Let \( B(p, l, q) \) be the \( \infty \)-graph in \( G \). We first prove that \( |V(P_{d+1}) \cap V(C_p)| \geq 1 \) or \( |V(P_{d+1}) \cap V(C_q)| \geq 1 \). Assume, on the contrary, that \( |V(P_{d+1}) \cap V(C_p)| = 0 \) and \( |V(P_{d+1}) \cap V(C_q)| = 0 \). Let \( P_k : u_1 u_2 \cdots u_k \) be a shortest path such that \( u_1 \in V(P_{d+1}) \) and \( u_k \in V(C_p) \cup V(C_q) \). Then \( k \geq 2 \). Applying Lemma 2 to the edge \( u_1 u_2 \), we get a graph \( G^* \in \mathcal{B}^\infty_{n,d} \) with \( \rho(G^*) > \rho(G) \), a contradiction. Hence \( |V(P_{d+1}) \cap V(C_p)| \geq 1 \) or \( |V(P_{d+1}) \cap V(C_q)| \geq 1 \).

Let \( V' = V(P_{d+1}) \cup V(B(p, l, q)) \) and \( G' = G[V'] \) be the induced subgraph of \( G \). Then \( G \) is \( G' \) with some trees attached. Applying Lemma 2 to the non-pendant edges, we can similarly prove that all these attached trees are stars with centers in \( V' \). That is to say that \( G \) is \( G' \) with some pendant edges attached. Applying Lemma 3, we can further prove that all these pendant edges are attached at the same vertex of \( G' \).

From Fact 1, we can see that \( p = q = 3 \). Let \( P_{d+1} : v_1 \cdots v_i \cdots v_{i+s} \cdots v_{d+1} \), where \( v_{i+k} \in V(B(p, l, q)) \), \( k = 0, 1, \ldots, s \). We claim that the path \( a_1 \cdots a_l \) in \( B(p, l, q) \) lies on \( P_{d+1} \). Otherwise, if \( l \geq 2 \), we may assume that \( a_1 a_2 \notin E(P_{d+1}) \). Applying Lemma 2 to \( a_1 a_2 \) we get a graph \( G^* \in \mathcal{B}^\infty_{n,d} \) with \( \rho(G^*) > \rho(G) \), a contradiction. If \( l = 1 \) and \( a_1 \notin V(P_{d+1}) \), applying Lemma 3 to \( a_1 \) and \( v_i \) we get a graph \( G^* \in \mathcal{B}^\infty_{n,d} \) with \( \rho(G^*) > \rho(G) \), a contradiction. Hence the path \( a_1 \cdots a_l \) lies on \( P_{d+1} \). We distinguish the following four cases.

**Subcase 1.** \( |V(P_{d+1}) \cap V(C_p)| = |V(P_{d+1}) \cap V(C_q)| = 1 \). Applying Lemma 3, we have \( G = P_{d+1}^{\Delta_1} \). This contradicts Lemma 10.

**Subcase 2.** \( |V(P_{d+1}) \cap V(C_p)| = 2 \) and \( |V(P_{d+1}) \cap V(C_q)| = 1 \). We may assume that \( v_{i-1} v_i \in E(C_p) \) and \( v_j \in V(C_q) \). By Lemma 3, all the pendant edges, not lying on \( P_{d+1} \), of \( G \) must be attached at \( v_j \). So we may further assume that \( i \leq j \). By Fact 1 we have \( j \leq i + 1 \). If \( j = i + 1 \), applying Lemma 1 to \( v_i \) and \( v_{i+1} \), by similar reasoning as the proof of Lemma 2 we can obtain a graph \( G^* \in \mathcal{B}^\infty_{n,q} \) such that \( \rho(G^*) > \rho(G) \), a contradiction. Thus \( j = i \), and so \( G = P_{d+1}^{\Delta_1} \). This contradicts Lemma 10 when \( 2 \leq i < d \). For \( i = d \), it is easy to see that \( P_{d+1}^{\Delta_1} \). Applying Lemma 1 to vertices \( v_{d-1} \) and \( v_{d+1} \) of \( P_{d+1}^{\Delta_1} \), we have either \( \rho(P_{d+1}^{\Delta_1}(d)) < \rho(P_{d+1}^{\theta_1}(2)) \) or \( \rho(P_{d+1}^{\Delta_1}(d)) < \rho(P_{d+1}^{\theta_1}(d)) \), a contradiction.

**Subcase 3.** \( |V(P_{d+1}) \cap V(C_p)| = 1 \) and \( |V(P_{d+1}) \cap V(C_q)| = 2 \). By similar reasoning as Subcase 2, we can obtain a contradiction.

**Subcase 4.** \( |V(P_{d+1}) \cap V(C_p)| = |V(P_{d+1}) \cap V(C_q)| = 2 \). We may assume that \( v_{i-1} v_i \in C_p \), \( v_j v_{i+1} \in C_q \), and \( j \geq i \). By Fact 1, we have either \( j \leq i + 1 \) or \( j = i + 2 \), \( d(v_{i+1}) > 2 \). If \( j = i + 1 \), or \( j = i + 2 \), \( d(v_{i+1}) > 2 \), applying Lemma 1 to vertices \( v_i \) and \( v_{i+1} \) we can obtain a graph \( G^* \in \mathcal{B}^\infty_{n,d} \) such that \( \rho(G^*) > \rho(G) \), a contradiction. Thus \( j = i \). Applying Lemma 1 to
vertices $v_{i-1}$ and $v_{i+1}$ we can obtain a graph $G^* \in \mathcal{R}_{n,d}^\theta$ such that $\rho(G^*) > \rho(G)$, a contradiction.

**Case 2.** Suppose that $G \in \mathcal{R}_{n,d}^\theta$. Let $P(l, p, q)$ be the $\theta$-graph in $G$. By similar reasoning as Case 1, we can prove that $|V(P_{d+1}) \cap V(P(l, p, q))| \geq 1$. Let $V' = V(P_{d+1}) \cup V(P(l, p, q))$ and $G' = G[V']$ be the induced subgraph of $G$. By similar reasoning as Case 1, we can further prove that $G$ is $G'$ with some pendant edges attached at one vertex. This implies that at most 5 vertices of $G$ have degree greater than 2.

By the definition of $P(l, p, q)$, we have that $l, p, q \geq 1$ and at most one of them is 1. Without loss of generality, we may assume that $l \leq p \leq q$. We claim that $l = 1$ and $p = q = 2$. Indeed, if $l \geq 2$, by Fact 1 and the fact that at most 5 vertices of $G$ have degree greater than 2, we have $l = p = q = 2$ and the two vertices of degree 2 of $P(l, p, q)$ lie on $P_{d+1}$, the third vertex, denoted by $w$, of degree 2 of $P(l, p, q)$ is attached by some pendant edges. Applying Lemma 2 to $aw$ in $G$ (a is as given in Fig. 2), we obtain a graph $G^* \in \mathcal{R}_{n,d}^\theta$ such that $\rho(G^*) > \rho(G)$, a contradiction. So $l = 1$. Similarly, by Fact 1 we can show that $p \leq q \leq 3$ and that if $q = 3$ then $p = 2$. If $q = 3$, denote $P_{q+1} = awb$, where $a$ and $b$ are shown in Fig. 2. By Fact 1, we have $d(u) > 2$ and $d(v) > 2$. In the case when neither $au$ nor $vb$ lies on $P_{d+1}$, applying Lemma 2 to $bu$, we obtain a graph $G^* \in \mathcal{R}_{n,d}^\theta$ such that $\rho(G^*) > \rho(G)$, a contradiction. So we may assume that $au$ lies on $P_{d+1}$. If neither $uv$ nor $ab$ lies on $P_{d+1}$, applying Lemma 2 to $bv$, we obtain similarly a contradiction. Otherwise, $G$ must be the graph $G^*$ shown in Fig. 9. Apply Lemma 1 to $u$ and $w$, we obtain a graph $G^* \in \mathcal{R}_{n,d}^\theta$ such that $\rho(G^*) > \rho(G)$, a contradiction. So, in further, $l = 1, p = q = 2$.

**Subcase 1.** $|V(P_{d+1}) \cap V(P(l, p, q))| = 1$. Applying Lemma 3, we can prove that $G = G_1(i)$ or $G_2(i)$. By Lemma 11 we have $G = G_2(2) = P_{d+1}^\theta(2)$. Since $d \geq 3$, by Lemma 6 we have $\rho(G_2(2)) < \rho(P_{d+1}^\theta(3))$, a contradiction.

**Subcase 2.** $|V(P_{d+1}) \cap V(P(l, p, q))| = 2$. If one edge of $P_{p+1}$ or $P_{q+1}$ lies on $P_{d+1}$, we may assume that $P_{p+1} = awb$ and $au$ lies on $P_{d+1}$. Applying Lemma 1 (and Lemma 6, if necessary) to $u$ and $b$ we can obtain a graph $G^* \in \mathcal{R}_{n,d}^\theta$ such that $\rho(G^*) > \rho(G)$, a contradiction. If $P_{q+1}$ lies on $P_{d+1}$, by Fact 1, Lemmas 1 and 2 we can similarly prove that all the pendant edges, not lying on $P_{d+1}$, of $G$ must be at one of $a$ and $b$. That is to say that $G = P_{d+1}^\theta(i)$. For $d \geq 5$, by Lemmas 6, 12 and 13, we have further

$$\rho(P_{d+1}^\theta(i)) < \rho\left(P_{d+1}^\theta\left(\left\lceil \frac{d+3}{2} \right\rceil\right)\right) < \rho\left(P_{d+1}^\theta\left(\left\lfloor \frac{d+3}{2} \right\rfloor\right)\right),$$

a contradiction. For $d = 4$, applying Lemmas 6 and 9, by direct calculation we have $\rho(P_{d+1}^\theta(2)) < \rho(P_{d+1}^\theta(3)) < \rho(P_{d+1}^\theta(4)) < \rho(P_{d+1}^\theta(5))$. By Lemma 13 we have $\rho(P_{d+1}^\theta(4)) < \rho(P_{d+1}^\theta(3)) < \rho(P_{d+1}^\theta(5))$. That is to say that $\rho(P_{d+1}^\theta(i)) < \rho(P_{d+1}^\theta(3))$, a contradiction. For $d = 3$, by Lemma 9 we have $\rho(P_{d+1}^\theta(4)) < \rho(P_{d+1}^\theta(5))$. Hence $G = P_{d+1}^\theta(i)$.

**Subcase 3.** $|V(P_{d+1}) \cap V(P(l, p, q))| = 3$. Then $G$ must be $G_0(i)$ (see Lemma 14) with $n - d - 2$ pendant edges attached at $v_j$, where $2 \leq i, j \leq d$. By Fact 1 we may assume that $i \leq j \leq i + 2$. If $j = i + 2$, applying Lemma 1 to $v_j$ and $v_{i-1}$, we can obtain a graph $G^* \in \mathcal{R}_{n,d}^\theta$ such that $\rho(G^*) > \rho(G)$, a contradiction. So $G$ must be $P_{d+1}^\theta(i)$ or $G_3(i)$ for some $i$. By Lemma 14, we have $G = P_{d+1}^\theta(i)$. By Lemma 15, we have further $G = P_{d+1}^\theta\left(\left\lceil \frac{d+2}{2} \right\rceil\right)$. For $d = 3$, applying Lemma 9, by direct calculation we have $\rho(P_{d+1}^\theta(2)) < \rho(P_{d+1}^\theta(3))$, a contradiction.
Combining Cases 1 and 2, we have $G = P_{d+1}^+(\left\lfloor \frac{d+2}{2} \right\rfloor)$ for $d \geq 4$ and $G = P_4^\theta(3)$ for $d = 3$.

This completes the proof. \(\square\)

By Lemma 6, we have $\rho\left(P_{d+1}^+(\left\lfloor \frac{d+2}{2} \right\rfloor)\right) < \rho\left(P_d^+(\left\lfloor \frac{d+1}{2} \right\rfloor)\right)$ for $d \geq 5$. Moreover, it is easy to see that $P_3^{\nabla\nabla}(2)$ and $P_3^+(2)$ are all bicyclic graphs with $n$ vertices and diameter 2. Applying Lemma 9, by direct calculation we can show when $n \geq 9$

$$\rho(P_3^+(2)) > \rho(P_3^{\nabla\nabla}(2)) > \rho(P_4^\theta(3)) > \rho(P_5^+(3)).$$

Combining these inequalities and Theorem 1, we have the following two corollaries.

**Corollary 1.** Let $d \geq 4$, and $G$ be a bicyclic graph on $n$ vertices with diameter not less than $d$. Then

$$\rho(G) \leq \rho\left(P_{d+1}^+(\left\lfloor \frac{d+2}{2} \right\rfloor)\right),$$

and the equality holds if and only if $G = P_{d+1}^+(\left\lfloor \frac{d+2}{2} \right\rfloor)$.

**Corollary 2.** Let $n \geq 9$. The first three graphs among all bicyclic graphs on $n$ vertices, ordered according to their spectral radii in decreasing order, are $P_3^+(2)$, $P_3^{\nabla\nabla}(2)$ and $P_4^\theta(3)$.
